# UBC Immunologist Cautions People On COVID Vaccine Safety & Efficacy

BY ARJUN WALIA · NOVEMBER 16, 2021 · 4 MINUTE READ

Coronavirus COVID-19 single dose small vials and multi dose in scientist hands concept. Research for new novel corona virus immunization drug.

## IN BRIEF

521 Share

- Dr. Steven Pelech, a professor of Immunology and Neurology at the University of British Columbia shares his thoughts and concerns about vaccine injuries, efficacy as well as natural immunity.
- The full interview was posted by the Strong and Free Truthcast.

### Reflect On:

- Why are academics who share information and evidence that opposes the mainstream narrative never given any attention?
- Are the measures being implemented really for the protection of everybody, or could something else be going on here?

## Pause - set your Pulse...

Take a breath. Release the tension in your body. Place attention on your physical heart. Breathe slowly into the area for 60 seconds, focusing on feeling a sense of ease. [Click here](#) to learn why we suggest this.

---

[Dr. Steven Pelech](#) has been a professor of immunology and neurology at the University of British Columbia (UBC) in Canada for 33 years. He is one of the founding members of the Biomedical Research Center at UBC. He is the founder of two biotech companies, and is also one of the founding members of the [Canadian Covid Care Alliance](#) and the Chair of the Scientific and Medical Advisory Committee.

He [recently appeared](#) on the Strong and Free Podcast on November 4th talking about all things COVID.

He began by talking about a study about natural immunity he and two dozen other scientists [published](#) back in March 2021 in the journal *American Society for Clinical Investigation*.

“Close to 90% of the people tested [in the first study] had evidence of having antibodies that would recognize 2 of the 28 proteins in the virus. Our company then did a follow up study with the same samples where we examined a lot more proteins in the virus and we completely confirmed the data that they had. These antibodies are not only there, but they are protective...We’ve tested over 1500 people now. In Canada we would anticipate that somewhere between 70 and 75% of the population has already been infected and has antibodies.”

Pelech

There have been more than one hundred studies published regarding natural immunity. You can view most of them [here](#) if interested. What’s interesting about the study he took part in is fact that it was done using uninfected patients, yet they still had robust protection.

“This concept that the vaccine-induced immunity is superior in any way to natural immunity is sheer nonsense. Anyone who says this should consult a first-year immunology textbook...We now know that these Covid vaccines that use the RNA or that use the

are in hospital in Israel are double-vaccinated.”

Pelech

He also brought up vaccine injuries. According to his estimates,

About 1 in 500 people who have been vaccinated have a very, very serious injury from the vaccine that may require hospitalization and can in fact kill them.

Pelech

He may be correct. We can't say for sure. What we can say is that [approximately 50 percent of serious adverse events reported in the CDC's Vaccine Adverse Events Reporting SyStem \(VAERS\) in the last 30 years are all from COVID shots.](#) Below are a few examples of reports from VAERS.

A recent death involved a 12-year-old girl (VAERS I.D. 1784945) who died from a respiratory tract hemorrhage 22 days after receiving her first Pfizer product dose. Another recent death is the case of a 16-year-old girl (VAERS I.D. 1694568) who died of pulmonary embolism 9 days after a Pfizer product dose (whether it was the first or second is unknown).

Yet another recent death was that of a 15-year-old boy who died six days after receiving his first dose of Pfizer product. The VAERS report (I.D. 1764974) states that the previously healthy teen 'was in his usual state of good health. Five days after the vaccine, he complained of shoulder pain.

swing, flipping in the air, and landing in the water feet first. He surfaced, laughed, told his friends “Wow, that hurt!”, then swam towards the shore, underwater as was his usual routine. The friends became worried when he did not reemerge.

His body was retrieved by local authorities more than an hour later.’ The autopsy revealed ‘small foci of myocardial inflammation’, an adverse effect of these COVID products commonly found among children and youth, particularly young men.

There’s a strong possibility adverse events are also underreported. A [study](#) published on October 7, 2021 in the Journal Toxicology Reports estimates that underreporting of deaths as a result of the COVID vaccines may have resulted in a number 1000 times less than what the actual number is. They also cite a widely distributed [Harvard Pilgrim study](#) published in 2010 which reported that less than 1 percent of vaccine injuries are probably reported. This includes serious adverse reactions.

Pelech then goes on to state the following,

“The younger you are the more at risk you are for myocarditis. We’re facing vaccinations of 5 to 12 year olds but it seems there are certain vaccine injuries that are more dramatic the younger you are, and myocarditis is one of them.”

Pelech

A recent [study](#) out of the University of California used VAERS to show the risk of [myocarditis](#) for teenage boys in the 12-15 age group is at least six times

people under the age of 30 for this reason.

COVID is less severe than the flu for children without comorbidities. [This is one of many science-based reasons why parents are hesitant to vaccinate their children.](#) Another reason are is the data regarding hospitalization and deaths. Children have a [99.97 chance](#) of surviving a COVID infection. According to Pelech, “SARS-CoV2 is actually much less deadly than influenza.”

History is littered with products that we, at the time, thought were safe but are actually very harmful. Glyphosate is one modern example, brought into market in the 1970s. DDT would be an even earlier one. Doctors used to prescribe cigarettes for stress relief.

One common thing these products, and many more, have in common is the fact that they were marketed and promoted as completely safe and effective. Dissenters and those who raised awareness about it were not appropriately heard, science was buried in by the power of the corporation.

This is indicative of criminal activity, which Pfizer is no stranger to. They’ve paid the largest criminal fines on the planet, [totalling billions of dollars.](#)

COVID vaccines are marketed in the same way. Completely safe and effective, but also completely necessary. So necessary that people are not allowed to work, travel, to to the gym etc without it while information that suggests otherwise is buried.
