BREAKING NEWS

Pfizer Study suggests Covid-19 Vaccine to blame for huge increase in Hepatitis among Children as UK Government launches Urgent Investigation

BY THE EXPOSÉ ON APRIL 9, 2022 • (20 COMMENTS)

Listen Now

The UK Health Security Agency has announced that it has recently detected higher than usual rates of liver inflammation (hepatitis) among children, but have ruled out the common viruses that cause hepatitis so have therefore launched an urgent investigation.

NEWS STORY

Increase in hepatitis (liver inflammation) cases in children under investigation

The UK Health Security Agency (UKHSA) has recently detected higher than usual rates of liver inflammation (hepatitis) in children. Similar cases are being assessed in Scotland.

From: [UK Health Security Agency](#)

Hepatitis is a condition that affects the liver and may occur for a number of reasons, including several viral infections common in children. However, **in the cases under investigation the common viruses that cause hepatitis have not been detected.**

Hepatitis symptoms include:

- dark urine
- pale, grey-coloured poo
- itchy skin
- yellowing of the eyes and skin (jaundice)
- muscle and joint pain
- a high temperature
- feeling and being sick
- feeling unusually tired all the time
- loss of appetite
- tummy pain

UKHSA is allegedly working swiftly with the NHS (<https://www.gov.uk/government/news/increase-in-hepatitis-liver-inflammation-cases-in-children-under-investigation>) and public health colleagues across the UK to investigate the potential cause. But it would appear they need not look any further than the experimental Pfizer Covid-19 injection they have outrageously been giving to children. Because Pfizer's own study confirms the mRNA jab accumulates in the liver causing hepatitis.

It was assumed that the Covid-19 vaccine's spike protein would remain at the injection site and last up to several weeks like other proteins produced in the body.

But as we all know assumptions make an ass out of u and me, and Pfizer's own study shows this is not the case and that spike proteins circulate in the body following mRNA Covid-19 vaccination, and the highest concentration ends up in the liver.

“The greatest mean concentration outside the injection site was observed in the liver, with values of 916 µg equiv lipid/g (equivalent to 21.5 % dose) in males and 30.411 µg equiv lipid/g (equivalent to 18.4 % dose) in females”

The Japanese regulatory agency’s bio-distribution study of the Pfizer vaccine shows that the contents of the Covid-19 injection travels from the injection site, through the bloodstream, and ends up in various organs such as the liver, spleen, adrenal glands, and ovaries for at least 48 hours after injection.

In animals that received the BNT162b2 injection, reversible hepatic effects were observed, including enlarged liver, vacuolation, increased gamma-glutamyl transferase (γGT) levels, and increased levels of aspartate transaminase (AST) and alkaline phosphatase (ALP) [source (<https://www.mdpi.com/1467-3045/44/3/73/htm#B26-cimb-44-00073>)].

cross pathology, and organ weights. At 100ug BNT162b2 V8 and 30ug BNT162b2 V9, the tissue at the injection site was thickened/enlarged with oedema and erythema at the end of exposure in a reversible manner. The spleen was enlarged (reversible) with up to 60% for both vaccine variants and doses. There was also an enlargement of the draining and inguinal lymph nodes at 100ug (BNT162b2 V8). Overall, there were signs of a significant immune response which is likely linked to the test substance. **There was a trend of slightly enlarged liver in females at 100ug (BNT162b2 V8) but not at 30ug (BNT162b2 V9).**

Histopathology: At 100ug BNT162b2 V8, there were observations of various inflammatory signs at the injection site (e.g. fibrosis, myofiber degeneration, oedema, subcutis inflammation and epidermis hyperplasia). Also, there was inflammation of the perineural tissue of the sciatic nerve and surrounding bone in most rats at d17. The bone marrow demonstrated increased cellularity and the lymph nodes showed plasmacytosis, inflammation and increased cellularity. The spleen demonstrated increased haematopoiesis in half the animals at d17. **The liver showed hepatocellular periportal vacuolation at d17** (fully reversed during recovery) which may be related to hepatic clearance of ALC0315. Histopathology assessment of 30ug BNT162b2 V9 generated similar results as 100ug BNT162b2 V8 although not on as extensive level (possibly due to a lesser dose). Minimal to moderate inflammation and oedema was observed at the injection site (usually resolved after ~3d). There was minimal to moderate increased

Source – Page 49

This was the driver for Aldén, et al from the Department of Clinical Sciences, Lund University, to examine the effect of BNT162b2 on a human liver cell line in vitro and investigate if BNT162b2 can be reverse transcribed into DNA through endogenous mechanisms. They published their paper in *Current Issues of Molecular Biology* (<https://www.mdpi.com/1467-3045/44/3/73>).

The authors of the paper found that when the mRNA Pfizer vaccine enters the human liver cells, it triggers the cell's DNA which is inside the nucleus, to increase the production of the LINE-1 gene expression to make mRNA.

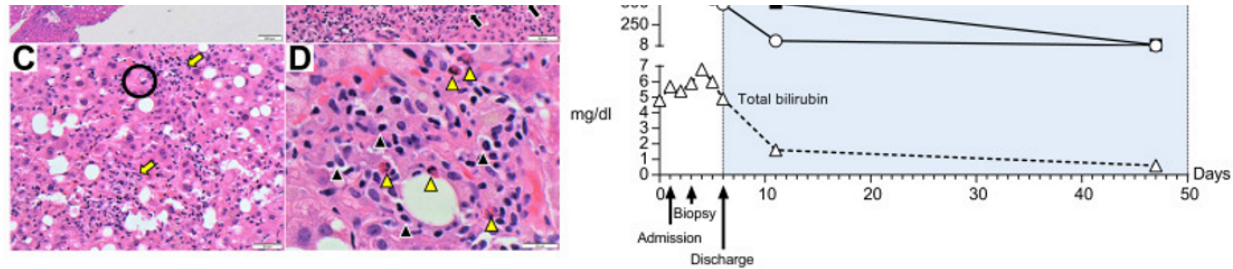

The mRNA then leaves the nucleus and enters the cell's cytoplasm, where it translates into LINE-1 protein. A segment of the protein called the open reading frame-1, or ORF-1, then goes back into the nucleus, where it attaches to the vaccine's mRNA and reverse transcribes into spike DNA.

Through conducting the study they also found spike proteins expressed on the surface of the liver cells that researchers say may be targeted by the immune system and possibly cause autoimmune hepatitis, as “there [have] been case reports on individuals who developed autoimmune hepatitis after BNT162b2 vaccination.”

The authors were referring to the [first reported case](https://www.journal-of-hepatology.eu/article/S0168-8278(21)00237-3/fulltext) ([https://www.journal-of-hepatology.eu/article/S0168-8278\(21\)00237-3/fulltext](https://www.journal-of-hepatology.eu/article/S0168-8278(21)00237-3/fulltext)) of a healthy 35-year-old female who developed autoimmune hepatitis a week after her first dose of the Pfizer COVID-19 vaccine. This led to a [study being conducted](https://www.journal-of-hepatology.eu/article/S0168-8278(21)00237-3/fulltext) ([https://www.journal-of-hepatology.eu/article/S0168-8278\(21\)00237-3/fulltext](https://www.journal-of-hepatology.eu/article/S0168-8278(21)00237-3/fulltext)) in which the authors concluded there is a possibility that “spike-directed antibodies induced by vaccination may also trigger autoimmune conditions in predisposed individuals”.

(A) Low-magnification (40x) shows pan-lobular hepatitis (black arrows: portal inflammation and yellow arrows: lobular inflammation).

The researchers Brill *et al* (2021) found that “severe cases of SARS-CoV-2 infection are characterised by an auto-inflammatory dysregulation that contributes to tissue damage,” which the virus’s spike protein appears to be responsible for. They also reported that histology revealed the presence of eosinophils, which are more commonly seen with drug or toxin-induced liver injury, although can also be found in cases of autoimmune hepatitis.

after COVID-19 vaccination. During pregnancy, she was diagnosed with gestational hypertension and started on labetalol 100 mg bid. C-section was performed without any complications, and patient was discharged from the hospital on labetalol for blood pressure control. She resumed her job as a healthcare provider in mid-December, and received her first dose of Pfizer-BioNTech COVID-19 vaccine on January 4th. After 1 week, she started developing generalized pruritus, then choloria, and finally noticed jaundice, presenting to the emergency room on day +13 after COVID-19 vaccination.

They argued that “It is also possible that we could be in the presence of a vaccine-related drug-induced liver injury with features of autoimmune hepatitis [...] symptoms developed 6 days after vaccination, which instinctively appears as a short period of time. However, latency periods after vaccination of just days have been observed in prior reports”.

We wonder if Chris Whitty will be able to sleep at night once the UKHSA proves the Covid-19 injection is to blame for this sudden increase in hepatitis among children? Afterall, not a single child would have been given the Covid-19 injection if it were not for the Chief Medical Officer for England overruling the Joint Committee on Vaccination and Immunisation which had previously concluded the benefits do not outweigh the risks.

Recently it has been found that vaccinated people are producing spike proteins even after more than 1 year. Spike proteins are found in lymph nodes of vaccinated people that has died. These spike proteins are causing blood clotting. Because every cell dna is changed by messenger rna vaccine, spike proteins will always be produced in every cell of the body. I don't want to scare any vaccinated friends here but the blood clotting risk is continuous. You need to detox yourself and boost your immune system in order to fight with these unnatural proteins. Ivermectin blocks ACE2 receptors to bind with spike proteins and helps to detox your body.

I make up to \$50 an hour working from my home. My story is that I quit working at Walmart to work online and with a little effort I easily bring in around \$40h to \$86h... Someone was good to me by sharing this link with me, so now i am hoping i could help someone else out there by sharing this link... Try it, you won't regret it.

😊 AND GOOD LUCK.:)

[...] Pfizer Study suggests Covid-19 Vaccine to blame for huge increase in Hepatitis among Children as UK ... The UK Health Security Agency has announced that it has recently detected higher than usual rates of liver inflammation (hepatitis) among children, but have ruled out the common viruses that cause hepatitis so have therefore launched an urgent investigation. [...]
